

ALLUS AI

Information Security Practices

Version: 1.0

Last Updated: July 2, 2026

Overview

Allus AI is committed to maintaining the confidentiality, integrity, and availability of customer data. Our platform is built using modern cloud infrastructure with security integrated throughout the software development lifecycle.

Security Principles

Security by Design • Least Privilege • Defense in Depth • Continuous Monitoring • Encryption Everywhere • Secure Software Development • Customer Data Isolation

Infrastructure Security

Hosted on AWS with isolated cloud environments, private VPC architecture, firewall protection, HTTPS/TLS, and cloud-native DDoS mitigation.

Identity & Access Management

RBAC, least privilege, MFA for administrative accounts, strong password policies, and immediate offboarding access revocation.

Encryption

TLS 1.2+ for data in transit and AES-256 encryption for data at rest, including encrypted databases and backups.

Customer Data Protection

Customer data is logically isolated between tenants. Access is restricted to authorized personnel for support and maintenance and is logged.

Application Security

Peer code review, automated testing, dependency vulnerability scanning, secure change management, and controlled production deployments.

Vulnerability Management

Continuous dependency scanning, infrastructure monitoring, patch management, and prioritized remediation of critical vulnerabilities.

Logging & Monitoring

Audit logs for authentication, administrative actions, infrastructure changes, and security events with ongoing monitoring.

Incident Response

Documented incident response process covering identification, containment, investigation, recovery, and customer notification where applicable.

Business Continuity

Automated backups, disaster recovery procedures, infrastructure redundancy where practical, and periodic review of recovery procedures.

Employee & Endpoint Security

Security awareness training, phishing training, encrypted company devices, automatic updates, endpoint protection, and screen lock enforcement.

AI Model Security

Controlled access to model infrastructure, secure handling of manufacturing data, tenant separation, monitored inference services, and version-controlled deployments. Customer data is not used to train shared foundation models without explicit authorization.

Compliance

Security program aligned with SOC 2 Security Trust Services Criteria, the NIST Cybersecurity Framework, and CIS Critical Security Controls as guiding principles.

Shared Responsibility

Allus AI secures the platform and infrastructure; customers manage user permissions, credentials, endpoint security, and integration configuration.
